

How to reuse a class in java ?

The design of java is "write once, run anywhere".

A public class created in one package can be reuse from different packages also by using import statement. (Note: import statement is available from the same package only).

In a single java file, we can declare only one public class that must be our java file and that class can be reusable to all packages.

In a single java file, we can write only one public class and multiple non public classes but it is not a recommended way because the root public classes we can use within the same package only.

So the conclusion is, we should declare every java class in a separate file to enhance the reusability of the J2EE classes.

[Note: If we have 10 classes -> 10 java files]

Now many class file will be created for the following programs
